AI ASSISTED CODING

ASSIGNMENT - 18

NAME: R.Teeneswari

HL-NO: 2303A51932 **BATCH:** 30

Lab 18.3:

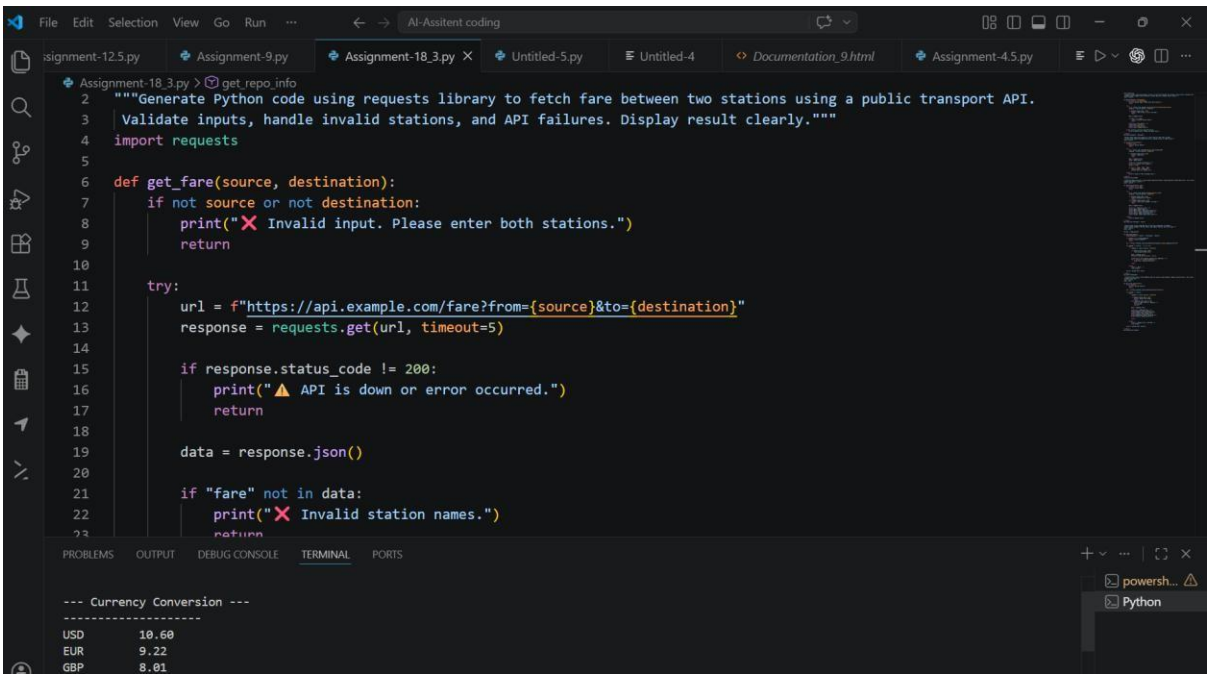
Task-1 :

PROMPT:

Generate Python code using requests library to fetch fare between two stations using a public transport API.

Validate inputs, handle invalid stations, and API failures. Display result clearly.

CODE:



OBSERVATION:

Input validation prevents empty values API failure handled using

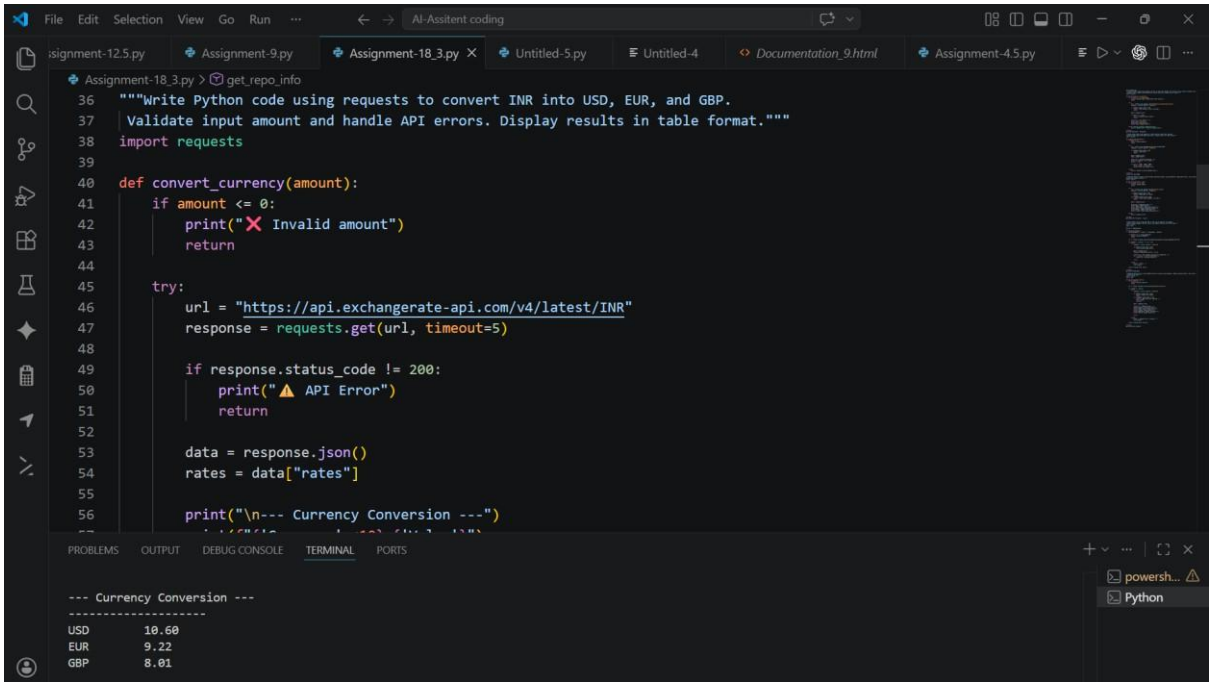
status codes Network errors handled with exception

TASK-2

PROMPT:

Generate Python function to fetch GitHub repository details using GitHub API. Handle 404 errors, rate limits, and invalid input.

Display repo details clearly CODE:



OBSERVATION:

Validates amount input Handles API downtime

Displays clean tabular output

TASK-3

PROMPT:

Write Python script using News API to fetch top 5 headlines by category.

Handle invalid category, API key issues, and request failures. Add retry logic.

CODE:

```python
"""Generate Python function to fetch GitHub repository details using GitHub API. Handle 404 errors, rate limits, and inva
Display repo details clearly."""
import requests

def get_repo_info(owner, repo):
    if not owner or not repo:
        print("❌ Invalid input")
        return

    try:
        url = f"https://api.github.com/repos/{owner}/{repo}"
        response = requests.get(url, timeout=5)

        if response.status_code == 404:
            print("❌ Repository not found")
            return
        elif response.status_code == 403:
            print("⚠️ Rate limit exceeded. Try later.")
            return

        data = response.json()
```

```
--- Repository Info ---
Name: linux
Description: Linux kernel source tree
Stars: 225829
Forks: 61255
Issues: 3
⚠️Retry...
⚠️Retry...
```

OBSERVATION:

Handles 404 (repo not found) Handles GitHub rate limiting Clean structured output

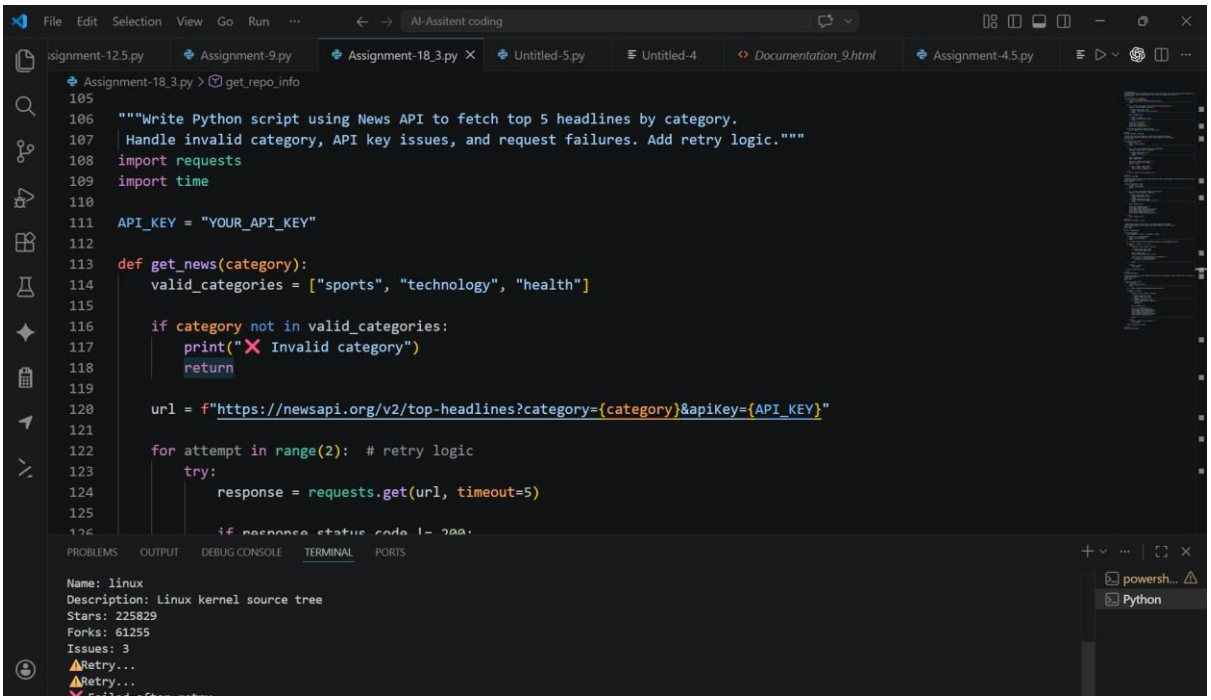
TASK-4

PROMPT:

Write Python script using News API to fetch top 5 headlines by category.

Handle invalid category, API key issues, and request failures. Add retry logic.

CODE:



OBSERVATION:

Validates category input

Retry mechanism improves reliability Displays user-friendly numbered

list

TASK-5

PROMPT:

Generate Python code to fetch COVID-19 stats by country using requests. Handle invalid country, rate limits, and network errors.

Include retry logic

CODE:

```python
"""Generate Python code to fetch COVID-19 stats by country using requests. Handle invalid country, rate limits, and netwo
 Include retry logic."""
import requests
import time

def get_covid_stats(country):
    if not country:
        print("❌ Invalid country")
        return

    url = f"https://disease.sh/v3/covid-19/countries/{country}"

    for attempt in range(3):
        try:
            response = requests.get(url, timeout=5)

            if response.status_code == 404:
                print("❌ Country not found")
                return
            elif response.status_code == 429:
                print("⚠️ Rate limit hit. Waiting...")
```

```
⚠️Retry...
❌ Failed after retry

--- COVID-19 Stats ---
Country: India
Total Cases: 45035393
Deaths: 533570
Recovered: 0
Active: 44501823
PS C:\Users\ARSHA THALLAPALLY\OneDrive\Desktop\AI-Assitent coding>
```

OBSERVATION:

Handles invalid country input Retry logic for rate limits

C failures Displays structured health data
